

This is an example for the new indent feature. Let's do some empty space indentation:

Here we go indented.

The Indention holds for the rest of the paragraph, or...
any new indent comes.

New paragraph, now indention is gone. But we can indent with a label also:

This is some label Here we go indented.

And again, the Indention holds for the rest of the paragraph, or any new indent comes.

Labels can be aligned:

Left Indent with label aligned to the left.

Center Indent with label aligned to the center.

Right Indent with label aligned to the right.

So, what can you do with that? How about lists:

- This is a list item
- Another list item
 - » Sub list item
- And yet another one

Also available with indents: Enumerators:

I. First item

II. Second item

a) A sub item

b) Another sub item

III. Third item

The following types are built in:

I RomanEnumerator

i LowerCaseRomanEnumerator

A AlphabeticEnumerator

a LowerCaseAlphabeticEnumerator

1 ArabianEnumerator

For your convenience, you can do all that much easier with markup, e.g. simple indention

At vero eos et accusam

And end the indention. Now a list:

- This is a list item
- Another list item
 - » A sub list item
- And yet another one

Even enumeration is supported:

1. This is a list item

2. Another list item

a) A sub list item

3. And yet another one

And you can customize it:

I -> This is a list item

II -> Another list item

a ~ A sub list item

III -> And yet another one
